

CLAIMS

I claim:

1. A bathroom wall mounted rack comprising:

mount, with wall end as one end. Holes are set on the wall mount and in the center one frame is perforated to the wall end;

fillister, installed on two opposite sides of the wall end of wall mount and the frame holes;

frame, without fixed pattern and the connector ends of frame just go through the frame holes on the frame in the center of wall mount; and

through hole, set on the connector ends of frame in the condition of radial transfixion.

The two ends of through hole are corresponding to the fillisters of wall mount;

bolt, going through the through hole of frame connector end. The two ends protrude on two sides of frame connector ends and further embed into two fillisters of wall mount correspondingly so as to connect and fix the frame and wall mount.

2. The wall mounted rack defined in Claim 1, wherein said fillister is in a space structure of sideling taper with two side walls.

3. The wall mounted rack defined in Claim 1 or 2, wherein said bolt is in a structure of hollow tube with C-shape cross section, which makes the outside diameter of the bolt elastic so as to be fixed in the fillister tightly.
